Alwin Joshy

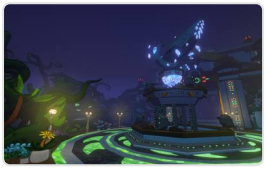

Unity Engineer

C# · Multiplayer / networking · Rendering performance · VR, WebGL, PC

Dubai, UAE · ajoshy300@gmail.com · alwinjoshy.github.io · linkedin.com/in/0merta · github.com/AlwinJoshy

SUMMARY

Unity Engineer with 6+ years building real-time 3D products in C# for VR, PC, WebGL and mobile, with deep rendering and multiplayer experience. At Highstreet (VR / PC MMO) I led network programming and technical art and owned performance and rendering budgets. Earlier I built features for HoloFair, an MMO-style virtual event platform in Unity WebGL, and led Dreamtopia from prototype to Steam release.

Highstreet: VR / PC MMO (Unity)

HoloFair: WebGL virtual events

Dreamtopia: Steam, lead developer

Pablo Let's Go Bar: Steam

Three.js hero scene (WebGL)

SKILLS

Unity engineering: C#, Unity (expert), gameplay and systems programming, C# editor tools and asset pipelines, UI/UX programming

Multiplayer & networking: Network programming for a VR / PC MMO (Highstreet), multi-user experiences (Knotgames), shared WebGL event spaces (HoloFair)

Performance & rendering: CPU/GPU profiling on WebGL, mobile and VR, draw-call reduction, SRP Batcher, GPU instancing, LOD and imposters, memory management, HLSL, Shader Graph, compute shaders

Platforms: PC (Steam), VR, WebGL, mobile

Also: C++, JavaScript, Three.js, React Native, Git, Unreal Engine

EXPERIENCE

Founder & Technical Artist | NPsynC

Feb 2026 – Present · Dubai, UAE

- Co-founded and run NPsynC, which provides AI digital-human staff (front-of-house, assistants, concierges) to government and semi-government agencies and companies.
- Create the company's digital humans in Unreal Engine (MetaHuman): modelling and texturing, rigging outfits, beard and eyebrow grooms, lighting and rendering.
- Characters talk in real time with live lipsync; NPsynC's own neural lipsync runs locally on the GPU and streams facial animation into Unreal Engine at 60 fps.

Unity Engineer & Technical Artist | Highstreet

Jan 2022 – Mar 2026 · Los Angeles, USA

- Led technical art and network programming for Highstreet's VR / PC MMO in Unity, and owned its performance and rendering budgets.
- Built a voxel light baker that bakes scene lighting into small 3D textures (one texture read per pixel, whatever the light count); a 45×34×45 volume is 268.9 KB, so each streamed VR scene block carries its own lighting. Used in the Arena and Lobby levels.
- When dense forest scenes dropped from 60–72 fps to 35–40 fps (sometimes ~15), built a circular-view imposter system: capture tool, texture atlas and a view-blending shader with normal / albedo relighting.
- Built VR grass: an editor painter, one combined mesh, proximity-activated zones and alpha clip with 4x MSAA, lit by the voxel light baker.
- Wrote custom shaders and tools for the environment art workflow, bridging the asset pipeline and the engine.
- Built a Shader Graph crystal shader: inset-edge meshes, parallax inner layers, sparkles, fake reflections and a growth dissolve.

Technical Artist & Network Programmer | Knotgames
Feb 2021 – Feb 2022

- Built network solutions and UI/UX systems for multi-user experiences, and coordinated the work.
- Owned QC, troubleshooting and optimisation of real-time rendering.
- Wrote custom HLSL shaders for specific art directions while holding 60 fps targets.

Technical Artist (Freelance) | BlueMonocle Software
Jun 2021 – Sep 2021

- Earlier contract (Aug 2020 – Mar 2021): React Native front-end development.
- Technical art direction for mobile and web projects.

C++ Student Support Tutor | SAE Institute
Jun 2020 – Aug 2021

- Tutored students in C++ memory management, pointers and data structures; post-lecture assistant.

Technical Artist & R&D (Internship) | Outreal XR, HoloFair
Nov 2019 – Aug 2020

- Built features in C# / Unity for HoloFair, an MMO-style virtual event platform in Unity WebGL and one of the first metaverse / virtual-event projects in the MENA region.
- Optimised assets and rendering so large shared event spaces ran smoothly in the browser.

Also: TrueBays Software, full-stack React Native developer (freelance, Jan 2021 – Oct 2021); SAE Institute, game developer and designer (paid internship, Jun 2018 – Jun 2019).

PROJECTS

- **Dreamtopia** (Steam, 2020 · Lead Developer): Took the game from prototype to Steam release with a team at SAE.
- **Pablo Let's Go Bar** (Steam, 2021 · Game Programmer & Rendering): Gameplay and rendering programming; won Best Project at the SAE Showcase 2021.
- **Portfolio hero scene** (Three.js / WebGL, 2026): Draco cut the land model from 17.65 MB to 1.87 MB (3D payload ~12 MB to ~4.4 MB); clouds in one instanced draw call; adaptive quality below 45 fps; fog matched to the sky.
- **Seven Battles** (itch.io, 2019): Browser game made as a marketing project for SAE.
- **Mesh to SDF in Unity** (Ray marching, 2026): Converts meshes to signed distance fields stored in small 3D textures and ray-marches them.
- **Time of Day Lighting Study** (Unity URP, 2026): One cabin scene lit for dawn, noon, dusk and night from the sun or moon, sky ambient, controlled bounce, reflections and a few support lights.

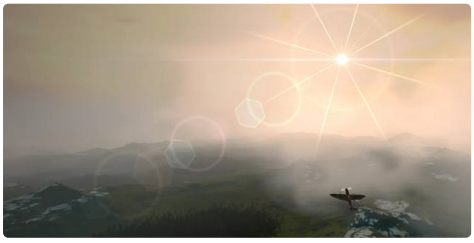

EDUCATION

Bachelor of Games Development (Games Programming) | SAE Institute
2018 – 2021 · GPA 6.5 / 7.0

ACHIEVEMENTS

- SAE Showcase Award 2021, Best Project: Pablo Let's Go Bar (Jun 2021).
- Shipped Dreamtopia on Steam (Jan 2020).
- Certificate of Appreciation, Liv. Hackathon, Amity University, Dubai Entrepreneurship Week (Oct 2019).

Languages: English (fluent), Spanish (conversational)
